

Arrow Puzzle Game — Complete Gameplay & Feature Specification

Textual reconstruction of the uploaded gameplay video • Approx. 24.9 seconds of video analyzed

1. Purpose / Game Concept

The video shows a mobile puzzle game called **Arrow Puzzle**. The core gameplay is an arrow-removal puzzle: the player is presented with a group of directional arrow paths and must tap/remove the arrows in a valid order. An arrow can leave the puzzle in the direction its arrowhead points when its path is clear. The objective is to remove every arrow and complete the level.

The game is simple to understand but becomes harder as the number and arrangement of arrows increases. The video demonstrates at least Level 1 and Level 2, with Level 2 containing a more complicated nested/overlapping arrangement.

2. Main Gameplay Loop

1. Start a level.
2. The level displays a set of arrow-shaped paths inside the play area.
3. Inspect the direction of each arrow.
4. Tap an arrow that can currently move/exit in its pointing direction.
5. The selected arrow animates out of the puzzle and disappears.
6. Continue selecting valid arrows until no arrows remain.
7. When all arrows are removed, show a **Level Completed!** celebration screen.
8. Allow the player to continue to the next level or return to the main screen.

3. Core Puzzle Mechanics

Arrow path: Each puzzle element is a line/path ending in an arrowhead. The arrowhead determines the direction in which that element exits the board.

Clear-path rule: An arrow should only be removable when nothing in the remaining puzzle blocks its movement in the direction of its arrowhead. The video shows arrows progressively disappearing and an arrow animation extending toward the screen edge before the element is removed.

Order matters: Some arrows are initially blocked by other paths. The player must remove blocking arrows first, which exposes previously blocked arrows.

Completion: The level is complete when all arrow elements have been successfully removed. The video shows a blue celebration screen with confetti and the text **Level Completed!**.

4. Level 1 Observed

Level 1 is a very simple introductory puzzle. The video shows a small number of vertical arrows, including upward- and downward-pointing arrows. The arrangement is sparse and intended to introduce the basic arrow-removal mechanic.

After solving the level, the game displays the Level Completed celebration. A preview of the solved puzzle is shown on the completion screen, along with a button for the next game/level and a Main option.

5. Level 2 Observed

Level 2 is substantially more complex. The gameplay screen shows a compact arrangement of multiple connected/nested arrow paths. The top UI displays the level number, three heart/life icons, a difficulty indicator labelled **Normal**, and an arrow counter showing approximately 6 arrows for the puzzle.

During the video, arrows are removed one by one. The visible puzzle progressively becomes smaller until only the final arrow/path remains. The last arrow is removed and the game transitions to the Level Completed screen.

Two circular assistance controls are visible near the bottom: a light-bulb button with a small numeric badge (hint-related) and a grid/hash-style button (a secondary puzzle/control function). A settings gear is visible at the top-right and a back arrow at the top-left.

6. Player Lives / Hearts

Level 2 visibly shows three red hearts at the top of the screen. This indicates a limited mistake/life system. The video does not clearly demonstrate a wrong tap, so the exact penalty for an invalid move should be implemented according to the intended game design: normally a wrong/blocked selection would consume one heart, while a correct selection removes the arrow.

Because the uploaded video does not show a failed attempt, the exact game-over behavior is not directly observable. Treat this as a feature requirement to confirm rather than as a confirmed behavior from the video.

7. Hints / Assistance

A light-bulb button is visible at the bottom of the Level 2 screen. It has a small badge containing a number, indicating available hints or hint count.

Likely intended behavior: tapping the hint button should identify, highlight, or automatically reveal a currently valid arrow. The exact hint behavior is not fully visible in the supplied video, so the UI element is confirmed but its exact action should be defined during implementation.

8. Difficulty

The Level 2 screen contains a pill labelled **Normal**. This suggests the game has a difficulty classification or selectable difficulty mode.

At minimum, the implementation should support a difficulty value associated with each level, such as Easy, Normal, Hard, etc. Difficulty can control the number of arrows, overlap/occlusion complexity, and/or available lives.

9. Level Completion Screen

When a puzzle is solved, the game switches to a bright blue celebration screen with radial rays and falling confetti.

The screen prominently displays **Level Completed!**. A white card in the center shows the completed puzzle/arrow arrangement as a visual result.

A large rounded button near the bottom is used to continue to the next game/level. A **Main** option is also shown so the player can return to the main area.

10. Main Navigation / Home

The video shows a bottom navigation structure with three sections labelled approximately **Main**, **Daily**, and **Me**. The selected section changes depending on the screen.

The Main area contains the regular level/game flow. Daily is used for daily challenges. Me is the user's profile/settings/achievement area.

11. Daily Challenges

A Daily Challenges screen is shown with the message **Welcome to Daily Challenges** and explanatory text stating that players can complete daily challenges every day and win gold stars.

A prominent **Continue** button appears in the introductory overlay, with a Play button visible behind it. This indicates a daily challenge mode separate from the normal level progression.

The daily section should therefore support at least: daily challenge availability, a challenge entry point, completion tracking, and a reward system based on gold stars.

12. Profile / Me Section

The Me screen contains a vertical menu with the following visible items:

Awards
Achievements
Settings
Help
About Game
Privacy Rights
Privacy Preferences
Remove Ads

This screen acts as the game's account/profile and utility area. The exact contents of each submenu are not shown in the video, but the navigation entries themselves are visible.

13. Awards / Achievements

The presence of separate **Awards** and **Achievements** entries indicates a progression/reward layer beyond simply completing levels.

A possible implementation is to award stars, badges, or achievement records for milestones such as completing levels, solving levels without mistakes, completing daily challenges, or reaching progression milestones. The specific achievement list is not visible in the supplied video.

14. Settings / Utility Features

The Me section exposes standard utility and information pages: Settings, Help, About Game, Privacy Rights, and Privacy Preferences.

The game also provides a **Remove Ads** entry, indicating an advertising-supported model with an optional ad-removal purchase or entitlement.

15. Observed Screen Flow

Launch / Main → Level 1 → Solve arrows → Level Completed → Next Game → Level 2 → Solve arrows → Level Completed

A second flow visible in the video is: **Main/Daily area → Daily Challenges introduction → Continue/Play.**

A third flow is: **Main → Me → Awards / Achievements / Settings / Help / About Game / Privacy Rights / Privacy Preferences / Remove Ads.**

16. Recommended Game State Model

GameState: currentLevel, difficulty, remainingArrows, lives, hints, score/stars, completionStatus.

Level: levelId, difficulty, arrowObjects, startingLives, startingHints, reward, nextLevelId.

Arrow: id, path/geometry, direction, currentPosition, blocked/unblocked state, active/removed state.

PlayerProgress: unlockedLevels, completedLevels, stars, achievements, dailyChallengeProgress, adRemovalStatus.

The puzzle should be deterministic for a fixed level definition so the same level can be reproduced, tested, and shared.

17. Implementation-Level Arrow Logic

For each arrow, determine whether its movement ray/path is obstructed by any currently active arrow/path. If no obstruction exists in the arrow's pointing direction, mark it as selectable.

On tap:

- If selectable: play exit animation → remove arrow → update remaining-arrow count → recompute which arrows are selectable.
- If blocked: treat as an invalid move according to the final life-system design → optionally decrement a heart and provide visual/audio feedback.
- If no arrows remain: trigger level completion.

The collision/visibility test is the central puzzle algorithm. The exact geometry can be implemented using line segments/polylines and directional ray intersection tests, or using a grid representation if levels are authored on a fixed grid.

18. UI Requirements

Gameplay screen should contain:

- Level title/number at top center
- Back button at top-left
- Settings button at top-right
- Lives/hearts indicator
- Difficulty indicator
- Remaining-arrow count
- Central puzzle board/play area
- Hint button
- Secondary puzzle/control button
- Bottom navigation or navigation controls where applicable

Visual style observed in the video: clean white gameplay background, dark navy arrow graphics, rounded UI controls, soft shadows, blue celebration screen, confetti, and bright accent colors.

19. Important UX Behavior

The game should make the next valid move understandable without requiring text instructions. The player learns the mechanic by observing arrow direction and whether an arrow has a clear path.

Successful removal should have a short directional animation so the player understands that the arrow has exited the board.

Completion should feel rewarding through the confetti celebration and clear next-level action.

Blocked/wrong selections should provide immediate feedback and should not silently do nothing.

20. What Is Confirmed vs. What Needs Confirmation

Confirmed from video: Arrow Puzzle name, level-based gameplay, directional arrow paths, progressive arrow removal, Level Completed celebration, Level 2 hearts, Normal difficulty label, hint button, secondary bottom control, daily challenges, stars/rewards concept, Me menu, Awards, Achievements, Settings, Help, About Game, Privacy Rights, Privacy Preferences, Remove Ads, and bottom navigation sections.

Not fully confirmed: exact rules for a blocked tap, exact heart/life penalty, exact hint behavior, exact secondary button behavior, scoring formula, star calculation, achievement conditions, ad frequency, account/login system, sound/vibration behavior, and exact level-generation algorithm.

21. One-Paragraph Brief for an AI Developer

Build a mobile puzzle game called **Arrow Puzzle**. The core mechanic is to remove directional arrow paths from a puzzle board in the correct order: the player taps an arrow, and if the arrow's path is clear in the direction of its arrowhead, it animates off the board and disappears. Removing one arrow can unblock other arrows, so the player must solve the puzzle through dependency/order reasoning. Levels increase in complexity. The game has lives/hearts, difficulty labels, hints, level completion celebrations, regular level progression, daily challenges with gold-star rewards, achievements/awards, and a Me/profile area containing Settings, Help, About Game, Privacy Rights, Privacy Preferences, and Remove Ads. The UI should be clean and mobile-first, with dark arrow graphics on a white board and a blue confetti-based completion screen.

22. Acceptance Criteria

A level can be authored with multiple directional arrow paths.

The game correctly determines whether an arrow is currently blocked.

A valid arrow tap animates the arrow out and removes it from the active puzzle.

Removing an arrow causes the game to recompute available moves.

The player can continue until all arrows are removed.

Completion triggers a dedicated Level Completed screen with a celebratory animation and next-level action.

The gameplay screen displays level number, lives, difficulty, and remaining-arrow count.

A hint control exists and is connected to a defined hint mechanic.

Normal level progression and a Daily Challenge mode are supported.

A Me/Profile area exposes Awards, Achievements, Settings, Help, About Game, Privacy Rights, Privacy Preferences, and Remove Ads.
